

Test of Cooling Vest in over lightning container.

Serie 2 is a man without Cooling Vest but full alarm set for Fire brigade. Serie 1 is with Cooling Vest. Both men had an outer body temperature of 32,2 C, when started to dress the alarm set with air bottles, at the Fire station. You can easily see that the Cooling Vest had a cooling effect, already on the way out to the training site as Serie 1 has a body temperature of 30,2 C. The temperature measuring started when arriving to the site. After 6 minutes the 2 men entered into the container, and after 23 minutes they went out. The temperature in the container was not measured, but the visor cracked at person Serie 2 after 12-14 minutes after entrance to the container.
